

“WEB MONITORING ON-LINE” is an easy way of data managing through dedicated web hosting. The website displays the monitored parameters in real-time automatically.

WEB MONITORING ON-LINE

The system allows data managing through essential operations such as communication with dataloggers, transmission and processing. All collected data are transferred to an FTP server via GPRS transmission where measurements are analysed, processed and finally published.

Visiting our web site www.iecitalia.it, the client can enter a secure dedicated database (through username and password) where monitored parameters are displayed in real-time. Web portal is divided into the following screenshots:

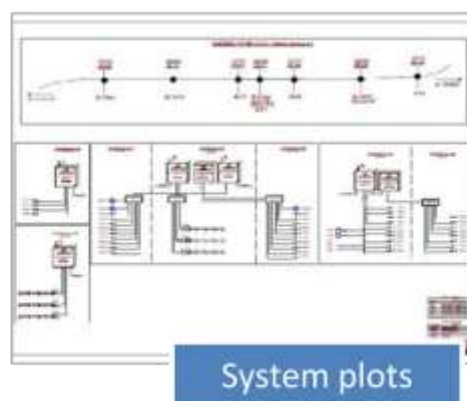

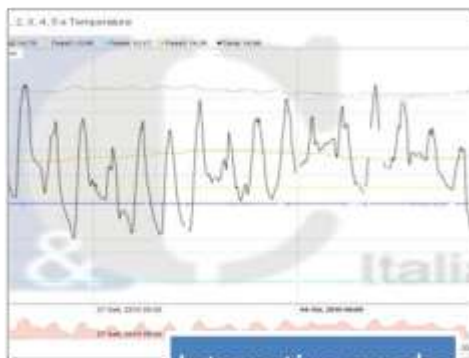

Other configurations can be developed on request.

FEATURES

Browsing the web portal, many operations can be performed:

- real-time monitored parameters visualization as graphs and display of selected sensors over selected period
- visualization of sensors positions on maps or pictures and real-time display of selected sensor measurement
- monitoring system plots visualization
- saving real-time graphs as jpg
- xls data export
- defining warnings and alerts for each sensor
